## **1. INTRODUCTION**

Government of Maharashtra (GoM) has decided to implement the World Bank aided Project on Climate Resilient Agriculture (PoCRA) i.e. Nanaji Deshmukh Krishi Sanjeevani Prakalp (NDKSP) under Department of Agriculture. The objective of this project is to enhance climate-resilience and profitability of small holding farmers in the selected districts of Maharashtra. The project aims to achieve the objective through promotion of climate resilient technologies and commodity value chain across approximately 4,000 drought-prone villages in 15 districts of Maharashtra.

Drought resilience is intricately related to the crop water requirements of different crops grown in the region, with the determination of local crop coefficients playing a pivotal role in optimizing irrigation strategies. Crop water requirements i.e. crop evapotranspiration refers to the combined water loss from two main processes in crops: evaporation from the soil surface and transpiration from the plants. Evaporation is the process by which water in the soil is converted into water vapour and released into the atmosphere, primarily driven by solar radiation and environmental conditions. Transpiration, on the other hand, is the movement of water from the plant roots, through the plant, and into the atmosphere through small pores (stomata) in the leaves.

The role of crop evapotranspiration in crop water requirement is crucial for efficient irrigation management and understanding the water needs of crops. It represents the total amount of water that a crop utilizes during its growth cycle. By accurately estimating crop evapotranspiration, farmers and water resource managers can make informed decisions regarding irrigation scheduling, ensuring that crops receive an adequate and timely water supply. Factors influencing crop evapotranspiration include climate conditions, crop type, growth stage, and the availability of soil moisture. Understanding and managing crop

evapotranspiration helps optimize water use efficiency, reduce water wastage, and enhance overall agricultural productivity. It is a key parameter in determining the irrigation needs of crops, contributing to sustainable water management practices in agriculture.

Reference crop evapotranspiration, which is the evapotranspiration of reference crop, that is fully grown and never short of water takes care of the weather characteristics. The crop evapotranspiration is then related to reference crop evapotranspiration through a factor called crop coefficient which varies over the growth period of crop. Thus the reference crop evapotranspiration and crop coefficient values are essential for estimating the crop water requirement.

Crop coefficient, denoted as  $K_c$ , is a factor in the crop's growth stage and guide the adjustment of reference evapotranspiration to estimate actual evapotranspiration. Currently most of the studies consider the crop coefficient values documented by FAO based on the average values all over the world. Therefore, consideration of the global averages of crop coefficient does not result in appropriate estimation of crop evapotranspiration and hence leads to inappropriate application of water, resulting in under or over irrigation and finally either in decreased productivity and/ or increased wastage of scarce water resources. As the evapotranspiration values are influenced by local climatic conditions, crop evapotranspiration values need to be measured locally and hence crop coefficient values need to be estimated locally. Though there is considerable variation in  $K_c$  values but there is no specific trend of variation between locally developed and FAO documented values, which translate in to 8 to 12% variation in the crop yield. Thus for the estimation of accurate crop water requirement, it is necessary to determine the crop coefficient values locally over the crop growth season for different crops of the regions. Moreover, locally developed  $K_c$  values provide the accurate values and thus the confidence amongst the users for estimating water requirement based on  $K_c$  values.

Weighing Lysimeters are extensively used to estimate and study crop water use patterns throughout crop growth and thereby standardize reference evapotranspiration models for the localized area to estimate crop-coefficient data for specific crops. The amount of water, which cultivated areas in a field require for evapotranspiration, might be precisely measured using a weighing Lysimeter. The applicability of Lysimeter for estimating the crop coefficient of various crops has been widely reported worldwide.

Thus, considering the importance of determining local crop coefficients of different crops in the region, Nanaji Deshmukh Krishi Sanjeevani Prakalp (formerly PoCRA) granted a project on **“Determination of Crop coefficients for Major Crops by Lysimetric Studies”** to Mahatma Phule Krishi Vidyapeeth, Rahuri with following objectives:

1. To estimate the values of crop coefficients of important field crops over their growth period by using Lysimetric study.
2. To estimate water requirement of different field crops for efficient irrigation water management.

## **2. LYSIMETER AND ITS INSTALLATION**

### **2.1 Overview**

Digital Weighing type Lysimeter was used to measure crop water used by measuring the change in mass of an isolated volume of soil. Lysimeters are used to calculate the water balance of the enclosed system. The water balance involves accounting for all the inputs and outputs of water, such as precipitation, irrigation, runoff, and changes in soil moisture. The primary objective of a Lysimeter is to establish a favourable and controlled environment that is identical to field conditions for the measurement of water balance. Evapotranspiration, which combines water evaporation from the soil surface and transpiration from plants, is a critical parameter measured by Lysimeter. This information is valuable for understanding the water requirement of crops.

In the project on “Determination of crop coefficients for major crops by Lysimetric studies” at Mahatma Phule Krishi Vidyapeeth, Rahuri, two Lysimeters were to be installed after procurement by Nanaji Deshmukh Krishi Sanjeevani Prakalp (formerly PoCRA) centrally.

First Lysimeter was delivered on the field on July 20, 2021. However, due to incessant rains, actual installation of the Lysimeter at  $19.32295^{\circ}\text{N}$  and  $74.652303^{\circ}\text{E}$  was done on November 15-16, 2021.

Second Lysimeter was delivered on field on April 5, 2023 and its installation was done on April 11-12, 2023 at Experimental Farm, AICRP on Irrigation Water Management, MPKV, Rahuri ( $19.215640^{\circ}\text{N}$  and  $74.383772^{\circ}\text{E}$ ).

Specifications of various components of digital weighting type Lysimeter and their function are given in the Table 1.

**Table 1: Specification and function of various components of digital weighting type****Lysimeter**

<b>Sr. No.</b>	<b>Component</b>	<b>Specifications</b>	<b>Functions</b>
<b>1.</b>	Inner box	1.5 x 1.5 x 1.25 m	To grow crop in an isolated environment.
<b>2.</b>	Outer box	1.6 x 2.1 x 1.25 m	To separate isolated mass of soil from surrounding environment.
<b>3.</b>	Weighing Scale	Size: 1.5 x 1.5 m High precision type, class II weighing scale indicator, capacity of 1000 kg and least count of 10 g.	Attached with 4 load cells which works on strain gauge principle which measures the weight of inner tank.
<b>4.</b>	Perforated plate	Corrosion resistant chicken type stainless steel mesh screen of 2 mm thickness (grade 304 SS) at about 10 cm from bottom.	To prevent washing out of soil along with drain water.
<b>5.</b>	Control Panel Box	0.4m×0.38m×0.26m. Made of corrosion free material.	Shows the weight of Soil water in inner tank & drain water in drain tank
<b>6.</b>	GI Pipe	Length 2m	For fitting for Solar panel and Control Panel
<b>7.</b>	Solar Panel Frame	Frame made of MS angle for fitting the Solar panel for the electric supply for data collection and data transmission.	For electric supply to charge battery which is required for data transmission & display.
<b>8.</b>	Drain tank	0.6 X 0.3 m MS tank	Measures the weight of drainage water from inner tank
<b>9.</b>	GSM Module	Sim Card and Device	To transmit data to web based application

## **2.1 Procedure for the Installation of Lysimeter**

The installation procedure involved meticulous site preparation, pit excavation, foundation laying, Lysimeter placement, back filling with soil layers, installation of accessories, and calibration to guarantee accurate and reliable measurements for subsequent studies. Step wise procedure followed for installation of Lysimeter is as given below. Photographs captured during installation of Lysimeter are shown in plates 1 to 14.

- 1. Site Selection:** A central location within the agricultural field was identified and selected for Lysimeter installation. The site was ensured to be easily accessible and cleared of potential interference.
- 2. Prepare the Site:** The selected area was cleared of vegetation and debris. The central point of the field was established, and the exact location for Lysimeter installation was marked.
- 3. Digging the Pit:** A pit was manually excavated at the chosen location to the size of the inner tank ( $1.5 \times 1.5 \times 1$  m). During excavation, soil was systematically set aside in layers of 20 cm thickness. Then, the pit was expanded with heavy machinery (JCB) to the size of the outer tank of the Lysimeter ( $1.6 \times 2.1 \times 1.25$  m).
- 4. Laying Foundation:** The bottom of pit was levelled using a Water Level for precision. A layer of bricks was placed at the base to establish a solid foundation for the Lysimeter.
- 5. Lysimeter Installation:** The Lysimeter (consisting of the outer tank, inner tank, and weighing frame) was carefully lowered into the pit with the help of Crane, ensuring it was level and securely positioned.
- 6. Backfilling of Soil:** The inner tank was backfilled with the soil layers kept separate during excavation to maintain soil structure. The last-excavated layer was placed on the perforated plate inside the inner tank first, and the initial layer was placed last.

**7. Installation of Accessories:** Temperature and moisture sensors were inserted at 30, 60, and 90 cm from the soil surface. The Drain Tank, Control Panel, battery, and Solar Panel were installed. Wires connecting the load cells to the Data Logger and GMS module were properly fitted.

**8. Calibration:** The Lysimeter was calibrated to ensure precise measurements, including weight sensor calibration and the setup of data logging systems.

successful installation and calibration**

### **3. METHODOLOGY**

#### **3.1 Important Terminologies:**

##### **i. Reference Crop Evapotranspiration (ET<sub>r</sub>):**

Evapotranspiration from the reference surface i.e. hypothetical grass i.e. reference crop with an assumed crop height of 0.12 m, a fixed surface resistance of 70 s/m and an albedo of 0.23 (Allen et al, 1998).

##### **ii. Evapotranspiration(ET):**

Evapotranspiration is the combined process of water evaporation from the soil surface and transpiration from plant surfaces into the atmosphere (Allen et al, 1998).

##### **iii. Crop Evapotranspiration(ET<sub>c</sub>):**

Evapotranspiration from disease-free, well-fertilized crops, grown in large fields, under optimum soil water conditions, and achieving full production under the given climatic conditions (Allen et al, 1998).

##### **iv. Crop Coefficient (K<sub>c</sub>):**

The crop coefficient, K<sub>c</sub>, is the ratio of the crop evapotranspiration (ET<sub>c</sub>) to the reference evapotranspiration (ET<sub>r</sub>), and it represents an integration of the effects of four primary characteristics (crop height, albedo, canopy resistance and evaporation from soil) that distinguish the crop from reference grass (Allen et al, 1998).

#### **3.2 Estimation of Reference Crop Evapotranspiration**

Reference crop evapotranspiration (ET<sub>r</sub>) during the crop growing season is estimated by using the Penman-Monteith method [Eq (3.1)].

$$ET_r = \frac{0.408\Delta(R_n - G) + \gamma \frac{900}{T + 273} u_2(e_s - e_a)}{\Delta + \gamma(1 + 0.34u_2)} \dots (3.1)$$

Where,

$ET_r$  = Reference evapotranspiration [mm/day],

$R_n$  = Net radiation at the crop surface [MJ/ m<sup>2</sup> day],

$G$  = Soil heat flux density [MJ/ m<sup>2</sup> day],

$T$  = Mean daily air temperature at 2 m height [°C],

$u_2$  = Wind speed at 2 m height [m/ s],

$e_s$  = Saturation vapour pressure [kPa],

$e_a$  = Actual vapour pressure [kPa],

$e_s - e_a$  = Saturation vapour pressure deficit [kPa],

$\Delta$  = Slope vapour pressure curve [kPa/ °C],

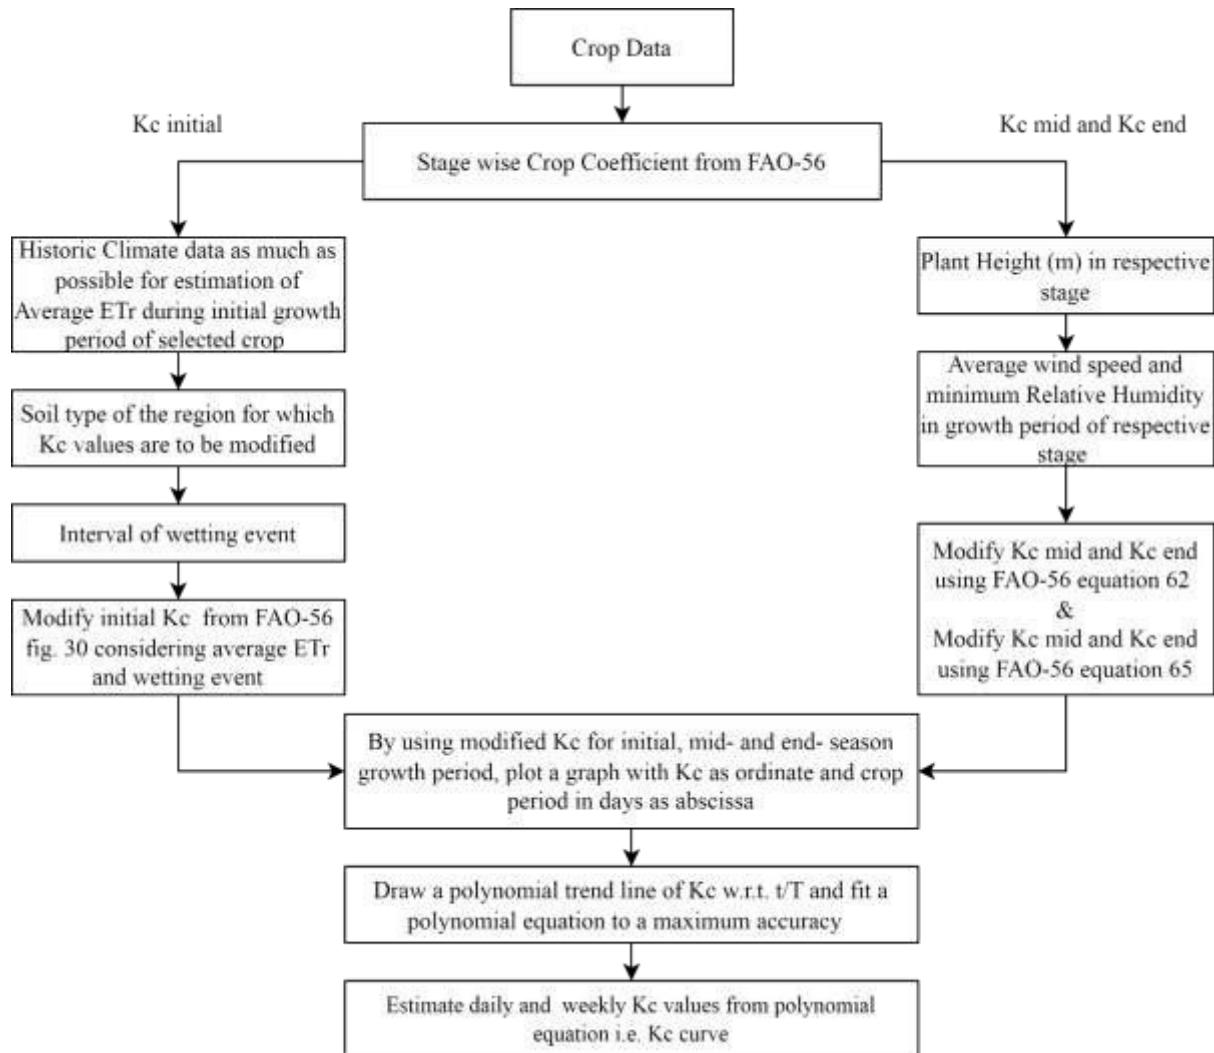

$g$  = Psychrometric constant [kPa / °C].

### **3.3 Methodology for modification of FAO-56 Crop Coefficients for local conditions**

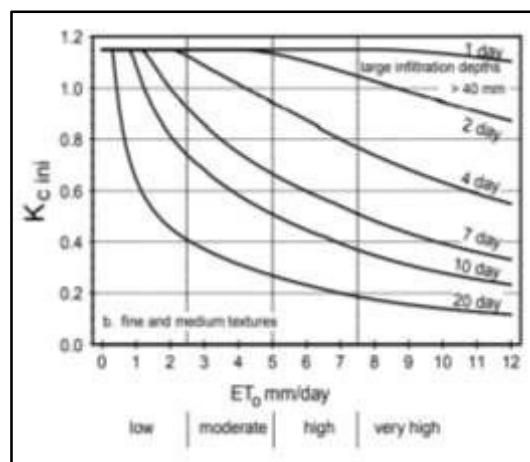

For modification of  $K_c$  values at local condition it is required to have the data related to soil type, wetting event and crop height at mid and end growth stage. Figure 3.1 shows the flow chart of methodology used for modification of  $K_c$  at initial, mid and end stages during crop growth period.

#### **i. Modification of $K_c$ (initial)**

The soil type of Rahuri region where the experiments were conducted is having fine and medium texture, therefore the irrigation interval was considered as 10 days.  $K_{c_{ini}}$  is taken from  $K_c$  vs  $ET_r$  graph (Figure 3.2) provided in FAO-56 paper using averaged  $ET_r$  value for previous 47 years, soil type/texture and wetting event for initial growth period. Average  $K_{c_{ini}}$  as related to the level of  $ET_r$  and the interval between irrigation greater than or equal to 40 mm per wetting event, during the initial growth stage for medium and fine textured soils is determined using figure 3.2.

**Figure 3.1: Methodology flowchart for modification of  $K_c$**

**Figure 3.2:  $K_c$  vs  $ETr$  graph provided in FAO-56 (Allen *et al*, 1998) paper for Medium and Fine Soil**

## **ii. Modification of Kc mid:**

The following equation is used for estimation of K<sub>c</sub> mid:

$$K_c \text{ mid} = K_c(\text{mid})_{\text{FAO56}} + [0.04(U_2 - 2) - 0.004(RH_{\min} - 45)](h/3)^{0.3} \quad \dots\dots(3.2)$$

## **iii. Modification of Kc end:**

The following equation is used for estimation of K<sub>c</sub> end:

$$K_c \text{ end} = K_c(\text{end})_{\text{FAO56}} + [0.04(U_2 - 2) - 0.004(RH_{\min} - 45)](h/3)^{0.3} \quad \dots\dots(3.3)$$

Where,

K<sub>c</sub> (mid)<sub>FAO56</sub> = value of K<sub>c</sub> mid taken from FAO-56,

K<sub>c</sub> (end)<sub>FAO56</sub> = value of K<sub>c</sub> end taken from FAO-56,

U<sub>2</sub> = Mean value for daily wind speed at 2m height, m/s

RH<sub>min</sub> = Mean value for daily minimum relative humidity during the end season

growth stage,

h = Mean plant height during end-season (m)

The crop height, minimum relative humidity and wind speed at 2 metre height required for estimation of K<sub>c</sub> for mid and end season stages, was recorded and stage wise K<sub>c</sub> values were modified. The weekly K<sub>c</sub> values were developed by linear interpolation of K<sub>c</sub> initial, K<sub>c</sub> mid and K<sub>c</sub> end. The curve of weekly K<sub>c</sub> Vs t/T, where 't' is day after sowing and 'T' is total crop growth period in days, was plotted and a polynomial equation was fitted with maximum accuracy. Using developed polynomial equation, the daily K<sub>c</sub> values for the crop were calculated.

## **3.4 Estimation of Crop Evapotranspiration Using Lysimeter**

Lysimeter is used to measure crop evapotranspiration where the crop is grown in isolated tanks filled with soil. Weighing Lysimeters measure crop water used by measuring the change in mass of an isolated volume of soil. Irrigation and precipitation add water and increase the weight of the soil volume and drainage and evapotranspiration removes water

and decrease the weight. Water input and output is measured by Water Balance Method and then crop evapotranspiration is calculated using water balance method [Eq. (3.4)].

$$ET_c = P + I - \Delta S - D \quad \dots (3.4)$$

Where,

$ET_c$  = Crop Evapotranspiration, mm;

$P$  = Precipitation, mm;

$I$  = Irrigation, mm;

$\Delta S$  = Change in water storage, mm;

$D$  = Drainage, mm.

### 3.5 Estimation of Crop Coefficient and Development of Kc Curve

The  $K_c$  values were estimated for given crop as the ratio of crop evapotranspiration ( $ET_c$ ) to the reference evapotranspiration ( $ET_r$ ) estimated by Penman-Monteith method over crop growth period using Eq (3.5).

$$K_c = ET_c / ET_r \quad \dots (3.5)$$

Where,

$K_c$  = Crop Coefficient

$ET_c$  = Crop Evapotranspiration, mm

$ET_r$  = Reference Crop Evapotranspiration, mm

The polynomial equations of second, third, fourth and fifth orders are fitted to calculate daily  $K_c$ , with  $K_c$  as the dependent variable and  $(t/T)$  as the independent variable.

The best fit polynomial equation is selected based on maximum  $R^2$ .

General equation for  $K_{ct}$  can be written as:

$$K_{ct} = \sum_{n=0}^{5} a_{(n)} \left(\frac{t}{T}\right)^n$$

The different forms of second, third, fourth and fifth order polynomial equation are as below:

$$Kc_t = a_0 \left( \frac{t}{T} \right)^0 + a_1 \left( \frac{t}{T} \right)^1 + a_2 \left( \frac{t}{T} \right)^2$$

$$Kc_t = a_0 \left( \frac{t}{T} \right)^0 + a_1 \left( \frac{t}{T} \right)^1 + a_2 \left( \frac{t}{T} \right)^2 + a_3 \left( \frac{t}{T} \right)^3$$

$$Kc_t = a_0 \left( \frac{t}{T} \right)^0 + a_1 \left( \frac{t}{T} \right)^1 + a_2 \left( \frac{t}{T} \right)^2 + a_3 \left( \frac{t}{T} \right)^3 + a_4 \left( \frac{t}{T} \right)^4$$

$$Kc_t = a_0 \left( \frac{t}{T} \right)^0 + a_1 \left( \frac{t}{T} \right)^1 + a_2 \left( \frac{t}{T} \right)^2 + a_3 \left( \frac{t}{T} \right)^3 + a_4 \left( \frac{t}{T} \right)^4 + a_5 \left( \frac{t}{T} \right)^5$$

Where,

$Kc_t$  = Crop Coefficient of  $t^{\text{th}}$  day.

$a_0, a_1, a_2, \dots$  = Constants of equations.

$t$  = Day considered after sowing.

$T$  = Total crop growth period from sowing to harvesting (days)

#### **4. CROP COEFFICIENTS OF SESAME, GRAM AND FODDER BAJRA**

In the project titled "Determination of Crop Coefficient for Major Crops by Lysimetric Studies" conducted at Mahatma Phule Krishi Vidyapeeth, Rahuri, the primary objective was to assess and establish crop coefficients for three major crops: Sesame, Gram (Chickpea), and Fodder Bajra (Pearl millet).

Lysimeters provide direct and accurate data on evapotranspiration, allowing researchers to quantify how much water the crops use at different growth stages. These measurements contribute to the determination of crop coefficients. The experiments involved monitoring and recording various parameters such as weather conditions, crop development stages, and water usage.

By conducting Lysimetric studies on Sesame, Gram, and Fodder Bajra, the research aimed to determine crop coefficients specifically for these crops under the local conditions of Mahatma Phule Krishi Vidyapeeth, Rahuri. Timeline of the experiments conducted are given in the table 4.1. The outcomes of these experiments are presented in this chapter.

**Table 4.1: Details of the experiments conducted under the project**

Sr. No.	Experiment	Year
1.	Determination of Crop Coefficient of <i>rabi</i> Gram	2021-2022
2.	Determination of Crop Coefficient of summer Fodder Bajra	2021-2022
3.	Determination of Crop Coefficient of <i>rabi</i> Gram	2022-2023
4.	Determination of Crop Coefficient of summer Sesame	2022-2023
5.	Determination of Crop Coefficient of summer Fodder Bajra	2022-2023
6.	Determination of Crop Coefficient of <i>kharif</i> Sesame	2023-2024

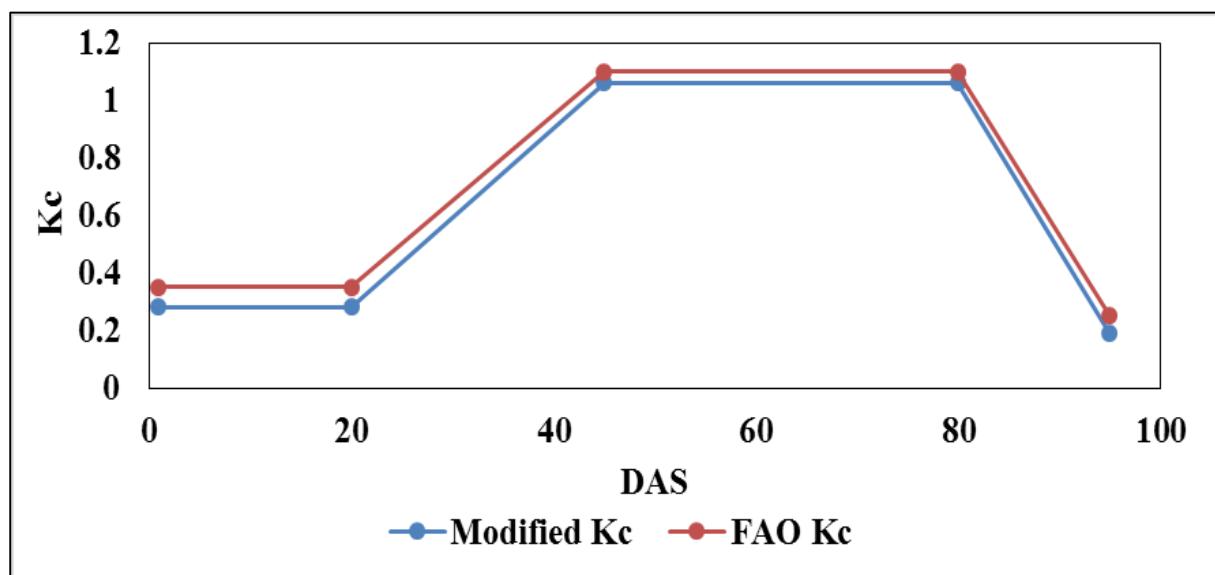

## 4.1 Crop Coefficients of Sesame

### 4.1.1 Modified Crop Coefficients of Sesame

Crop coefficients ( $K_c$ ) from the FAO-56  $K_c$  values were modified for sesame. The comparison between the original FAO-56  $K_c$  values and the modified ones for different growth stages is shown in Table 4.2. The modified  $K_c$  values were found to be lower than the FAO-56 standard for all the growth stages. The sesame crop required about 11.83% less water during its various growth stages than what the FAO-56 standard suggested. Graphical representation for comparison of modified and FAO-56  $K_c$  is shown in figure 4.1.

**Table 4.2: Week wise modified Crop Coefficient of Sesame**

Stage	Duration (Days)	Modified $K_c$	FAO - $K_c$	Weightage (%)	Change %
<b>Initial</b>	20	0.28	0.35	21.05	-20.00%
<b>Development</b>	25	0.67	0.74	26.31	-9.46%
<b>Mid</b>	35	1.06	1.1	36.85	-3.37%
<b>End</b>	15	0.19	0.25	15.79	-24.00%
<b>Weighted Average</b>					<b>-11.83%</b>

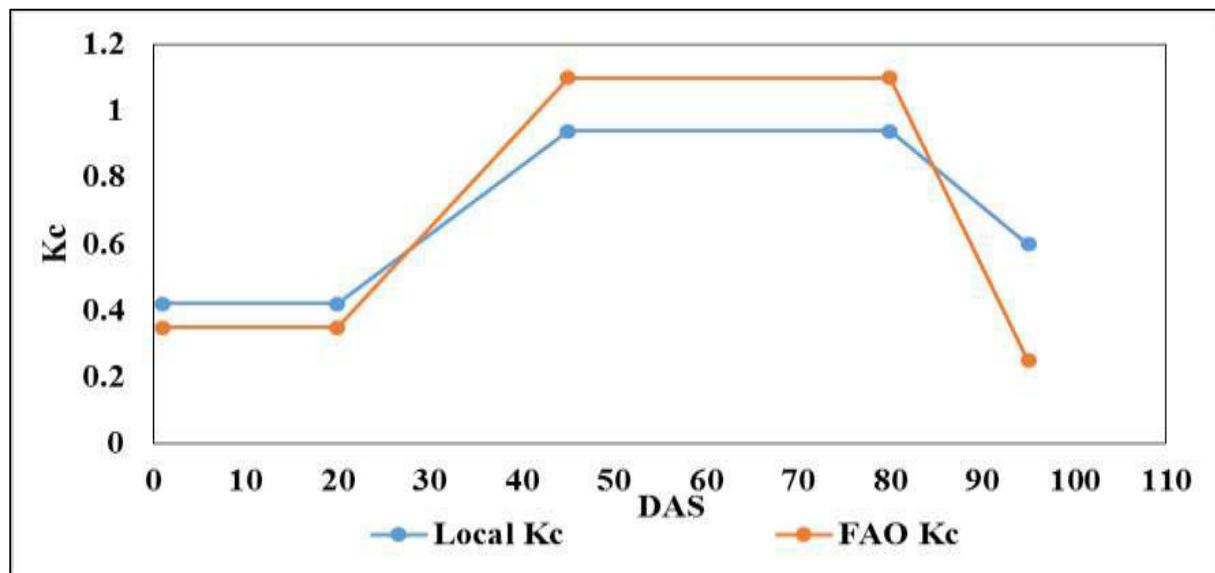

**Figure 4.1: Comparison of local and FAO-56  $K_c$**

#### 4.1.2 Local Crop Coefficients of summer Sesame with Lysimeter

During first year experiment, Sesame crop was grown in summer season. By considering average weekly Kc values, Kc curve was developed. The percentage change for each growth stage, also shown in the table, indicates the extent of this difference. The overall change is 21.31%, suggesting an increase in water demand for summer Sesame in the local climate. Graphical representation for comparison of local and FAO-56 Kc is shown in figure 4.2.

**Table 4.3: Stage wise crop coefficient developed for summer Sesame using Lysimetric Study**

Stage	Duration (Days)	Local Kc With Lysimeter	FAO - Kc	Weightage (%)	Change %
<b>Initial</b>	20	0.42	0.35	21.05	20.00%
<b>Development</b>	25	0.75	0.74	26.32	1.35%
<b>Mid</b>	35	0.94	1.1	36.84	-14.55%
<b>End</b>	15	0.6	0.25	15.79	140.00%
<b>Weighted Average</b>					<b>21.31 %</b>

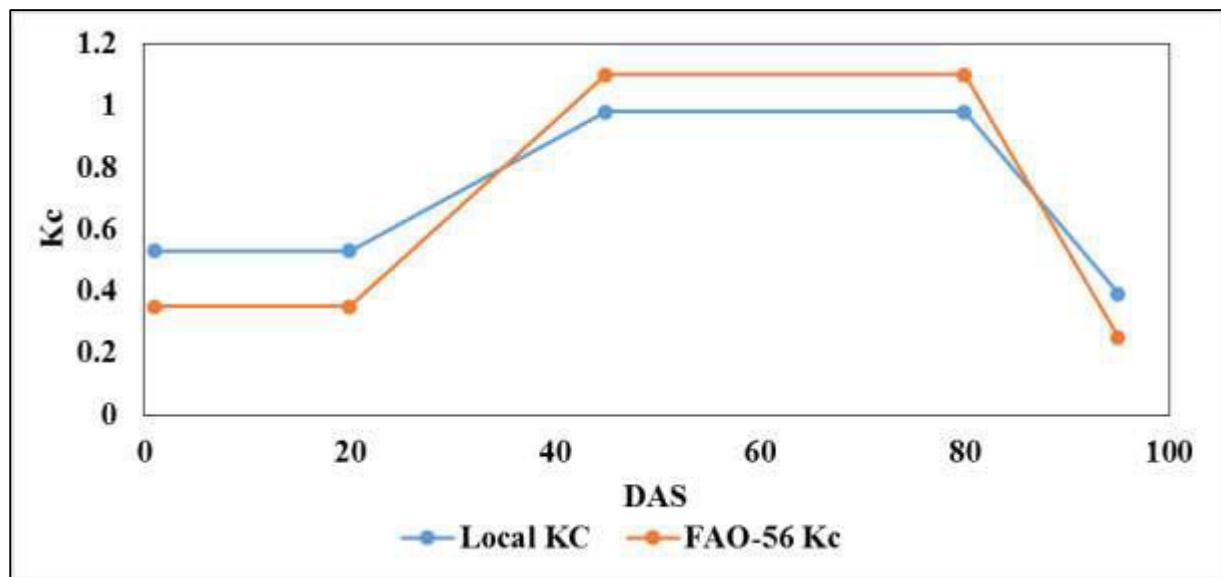

**Figure 4.2: Comparison of Modified and FAO-56 Kc**

#### 4.1.3 Local Crop Coefficients of *kharif* Sesame with Lysimeter

During second year experiment, Sesame crop was grown in *kharif* season. By considering daily Kc values, Kc curve was developed. Stage wise Kc values for *kharif* sesame are given in table 4.4. The percentage change for each growth stage, also shown in the table, indicates the extent of this difference. The overall change is 18.49%, suggesting an increase in water demand for *kharif* Sesame in the local climate. Graphical representation for comparison of local and FAO-56 Kc is shown in figure 4.3.

**Table 4.4: Stage wise crop coefficient developed for *kharif* Sesame using Lysimetric Study**

Stage	Duration (Days)	Local Kc with Lysimeter	FAO Kc	Weightage (%)	Change %
<b>Initial</b>	20	0.53	0.35	21.05	51.43%
<b>Development</b>	25	0.82	0.74	26.32	10.81%
<b>Mid</b>	35	0.98	1.1	36.84	-10.91%
<b>End</b>	15	0.39	0.25	15.79	56.06%
<b>Weighted Average</b>					<b>18.49%</b>

**Figure 4.3: Comparison of local and FAO-56 Kc for *kharif* Sesame**

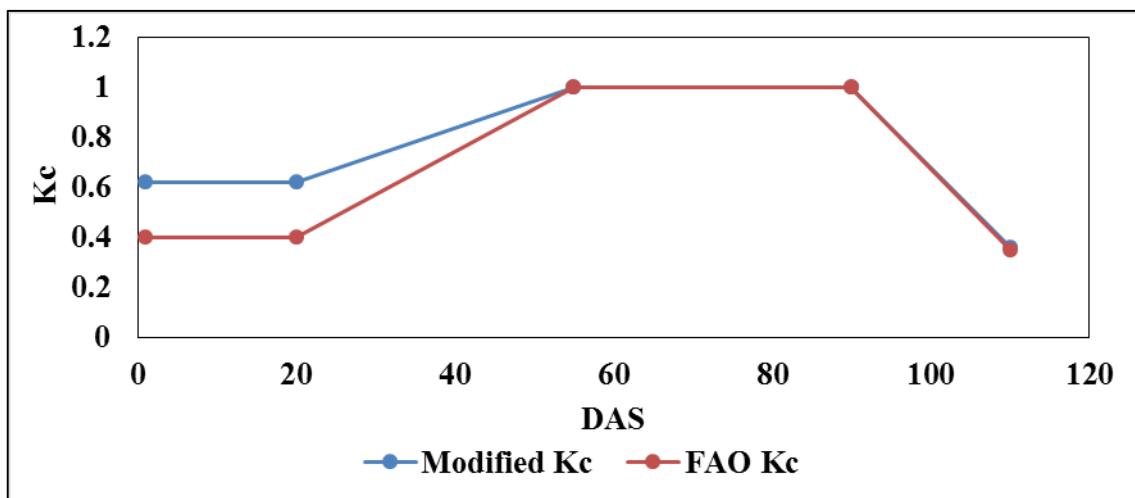

## 4.2 Crop Coefficients of *rabi* Gram

### 4.2.1 Modified Crop Coefficients of *rabi* Gram

FAO-56 crop coefficients for Gram crop are modified for local conditions of MPKV, Rahuri. Stage wise FAO-56 and modified Kc values are given in Table 4.5. The table provides a comparison of crop coefficients (Kc) for different growth stages, namely Initial, Development, Mid, and End, along with the corresponding duration, between the FAO-56 standard and modified crop coefficients. In the case of *rabi* Gram, the average change is 15.52%, indicating increase in water requirements based on modifications according to local climatic conditions. Comparison of modified and FAO-56 Kc is shown in figure 4.4.

**Table 4.5:Stage wise and week wise modified Crop Coefficient of *rabi* Gram**

Stage	Duration (Days)	Modified Kc	FAO Kc	Weightage (%)	Change %
<b>Initial</b>	<b>20</b>	0.62	0.4	18.18	55.00%
<b>Development</b>	<b>35</b>	0.81	0.7	31.82	15.21%
<b>Mid</b>	<b>35</b>	1.00	1.00	31.82	0.00%
<b>End</b>	<b>20</b>	0.36	0.35	18.18	2.86%
<b>Weighted Average</b>					<b>15.52%</b>

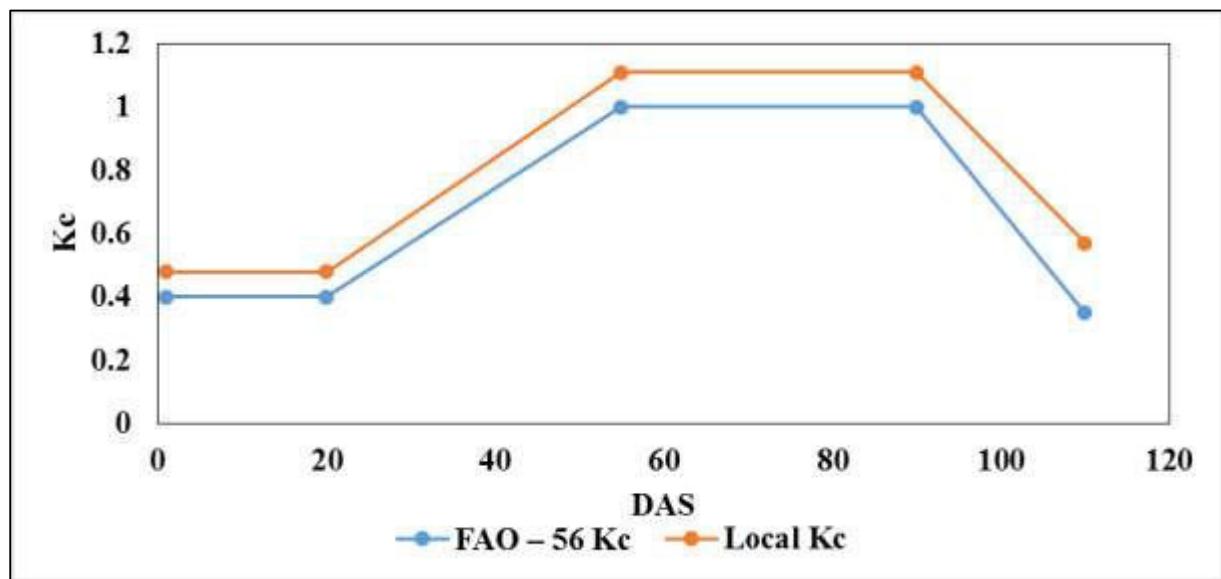

**Figure 4.4: Comparison of Modified and FAO-56 Kc for *rabi* Gram**

#### 4.2.2 Local Crop Coefficient of *rabi* Gram with Lysimeter

The average of stage wise Kc values the two years are given in Table 4.5. When comparing these values with the FAO-56 standard Crop Coefficients (Kc), it is observed that the locally developed Kc values are consistently higher across all stages. The percentage change for each growth stage, also shown in the table, indicates the extent of this difference. The overall change is 27.34%, suggesting an increase in water demand for *rabi* Gram in the local climate. Graphical comparison of FAO-56 Kc and local Kc *rabi* Gram is shown in figure 4.5.

**Table 4.6:Stage wise and week wise local Crop Coefficient of *rabi* Gram**

Stage	Duration (Days)	LocalKc with Lysimeter	FAO Kc	Weightage (%)	Change %
<b>Initial</b>	<b>20</b>	0.48	0.4	18.18	20.00%
<b>Development</b>	<b>35</b>	0.9	0.7	31.82	28.57%
<b>Mid</b>	<b>35</b>	1.1	1.00	31.82	11.00%
<b>End</b>	<b>20</b>	0.57	0.35	18.18	62.86%
<b>Weighted Average</b>					<b>27.34%</b>

**Figure 4.5: Comparison of local and FAO-56 Kc for *rabi* Gram**

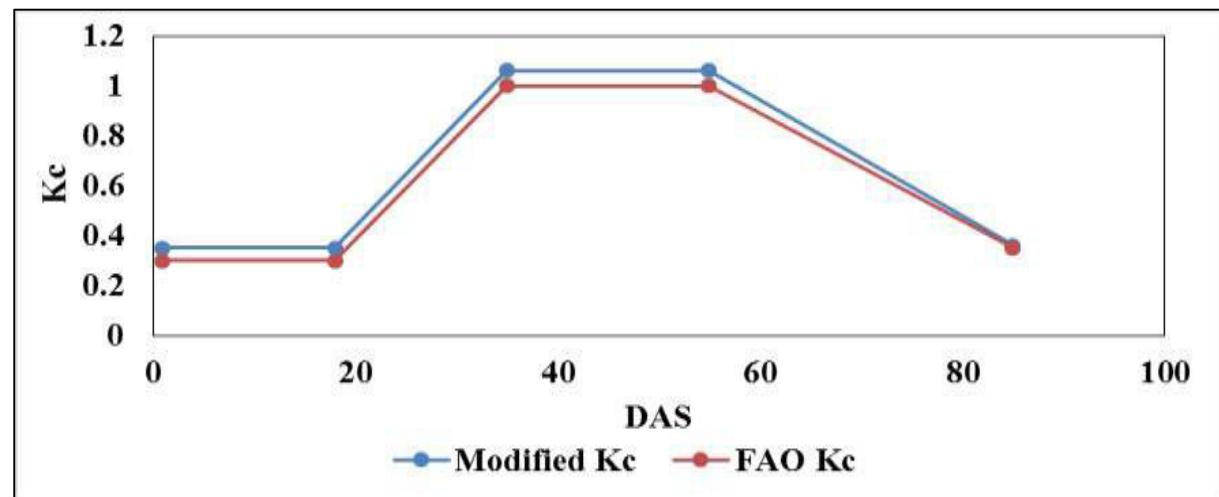

## 4.3 Crop Coefficients of Fodder Bajra

### 4.3.1 Modified Crop Coefficients of Fodder Bajra

The table 4.7 gives a comparison of crop coefficients ( $K_c$ ) for different growth stages, namely Initial, Development, Mid, and End, along with the corresponding duration, between the FAO-56 standard and modified crop coefficients. The comparison shows that, there is 16.67% increase during the initial growth stage, 6% increase in the mid-season, and 2.86% increase at the end of the season. In simpler terms, the modified crop coefficients indicate that, according to local considerations, Fodder Bajra requires 5.95% more water than what the FAO-56 standard suggests considering weighted average.

**Table 4.7: Modified Crop Coefficient for Summer Fodder Bajra.**

Stage	FAO – 56 $K_c$	Modified $K_c$	Duration	Weightage, %	Change, %
<b>Initial</b>	0.3	0.35	18	21.18	16.67%
<b>Development</b>	0.7	0.7	17	20.00	0.00%
<b>Mid</b>	1	1.06	20	23.53	6.00%
<b>End</b>	0.35	0.36	30	35.29	2.86%
<b>Weighted Average</b>					<b>5.95%</b>

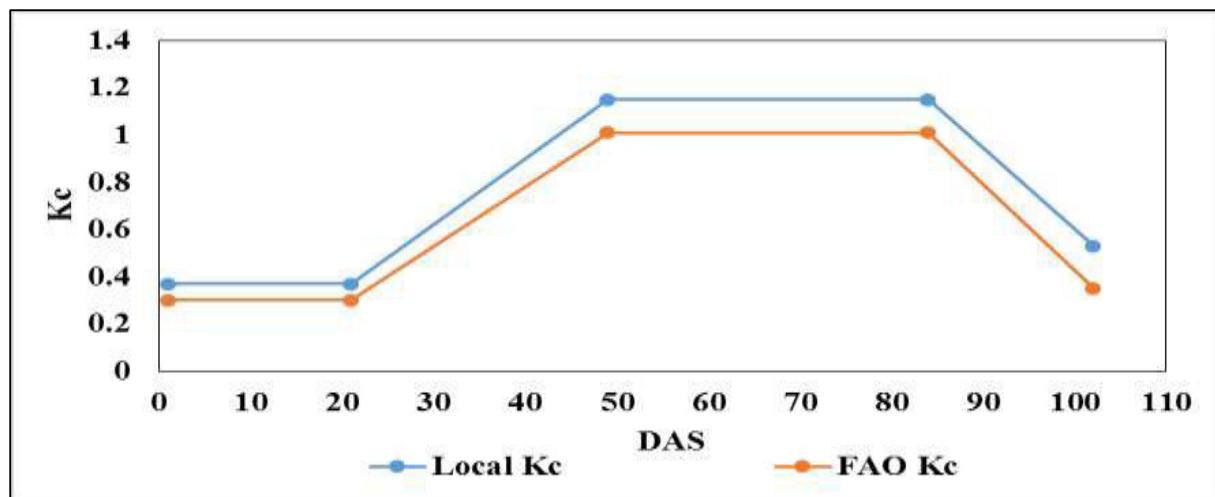

**Figure 4.6: Comparison of local and FAO-56  $K_c$  for Modified  $K_c$  for Summer Fodder Bajra**

#### 4.3.2 Local Crop Coefficients of Fodder Bajra (with single cut practice) with Lysimeter

During the summer season of 2022, experiment on determination of crop coefficient of fodder was conducted. For Fodder Bajra, specific Kc values during the initial, development, mid, and end stages were found to be 0.37, 0.87, 1.15, and 0.53, respectively. In comparison, the stage-wise Kc values according to FAO-56 were 0.30, 0.65, 1.01, and 0.35 for the corresponding stages. The percentage increase in local Kc values over FAO-56 Kc values is given in Table 4.8, indicating an overall increase of 31.48%. This suggests an increase water requirement for Fodder Bajra during the summer season. Graphical comparison of local Kc values over FAO-56 Kc values is shown in Figure 4.7.

**Table 4.8: Local Crop Coefficient for Summer Fodder Bajra.**

Stage	FAO 56 Kc	Local Kc with Lysimeter	Duration (Days)	Weightage, %	Change, %
<b>Initial</b>	0.3	0.37	18	21.18	23.33%
<b>Development</b>	0.7	0.87	17	20.00	24.29%
<b>Mid</b>	1	1.15	20	23.53	15.00%
<b>End</b>	0.35	0.53	30	35.29	51.43%
<b>Weighted Average</b>					<b>31.48%</b>

**Figure 4.7: Comparison of local and FAO-56 Kc for Fodder Bajra**

### **4.3.3 Crop Coefficients of Fodder Bajra (with 2 cuts practice) with Lysimeter**

In the experiment conducted in summer season of 2023, involving the 'Giant Bajra' variety of Fodder Bajra, two cuts were taken. The first cut was taken at 49 days after sowing, and second cut was made at 42 days after the first cut. Two crop coefficient ( $K_c$ ) curves were developed for this Fodder Bajra variety, considering standard harvesting time and protocol.

The table 4.9 outlines the stage-wise crop coefficients for Fodder Bajra during its growth cycle. The crop's development is divided into two phases: before and after the first cut, made 49 days after sowing. In the initial and development stages before the first cut, the crop coefficients are 0.64 and 1.34, respectively. After the first cut, when the fodder is regrown until 90 days after sowing, the crop coefficients for the development and mid growth stages are 0.77 and 1.24, respectively. Such a practice of harvesting fodder Bajra two times is not mentioned in FAO – 56. Hence, stage wise crop coefficients of Fodder Bajra having 2 cuts practice with Lysimeter were not compared with FAO values.

**Table 4.9: Stage wise crop coefficients of Fodder Bajra (with 2 cuts practice)**

Stage	Duration (Days)	Crop Coefficients with Lysimeter	
		Before first Cut ( 1 to 49 DAS)	After First Cut (50 to 90 DAS)
Initial	21	0.64	-
Development	28	1.34	0.77
Mid	14	-	1.24
End*	-	-	-

\* Bajra was harvested as green fodder, and was not allowed to dry. Therefore end stage was not considered in this experiment.

The values of weekly Crop Coefficient developed based on modifications made in FAO-56  $K_c$  considering local climate and growing conditions and developed by conducting Lysimetric Studies are given in Appendix – A.

## **5. PROCEDURE FOR ESTIMATION OF CROP AND IRRIGATION WATER**

### **REQUIREMENT FOR WESTERN MAHARASHTRA**

To compute Taluka wise Crop and Irrigation Water Requirement for Western Maharashtra Region following procedure was followed.

#### **1. Data Collection:**

Meteorological data from 22 Agricultural Research Stations in Western Maharashtra was collected. Minimum and maximum temperature data were obtained for the stations given in table 5.1.

#### **2. Reference Evapotranspiration:**

Reference crop evapotranspiration was calculated using the Hargreaves-Samani Method for these stations spread across western Maharashtra using Phule Jal ( a web based application for computing ETr developed by MPKV, Rahuri), using minimum and maximum temperature, and latitude of the stations.

#### **3. Spatial Interpolation:**

Daily Reference evapotranspiration values were converted into weekly values. Weekly values were spatially interpolated over the entire Western Maharashtra using the Inverse Distance Weight (IDW) method in ArcMap.

#### **4. Crop Coefficient Multiplication:**

The interpolated values were multiplied by the respective crop coefficients obtained from Lysimetric Studies for Sesame, Gram, and Fodder Bajra.

#### **5. Weekly Maps of Crop Water Requirement:**

Weekly maps of crop water requirement were developed for Western Maharashtra based on the multiplied values.

## **6. Shading Factor Consideration:**

For Sesame, Gram and Fodder Bajra, close-growing row crops, the shading factor was considered as 1 during the calculation of crop water requirement.

## **7. Geo-statistical Analysis:**

Geo-statistical Analysis tools in ArcMap were utilized to extract taluka-wise weekly crop water requirements using preloaded locations of all the taluka in Western Maharashtra.

## **8. Irrigation Water Requirement:**

Taluka-wise weekly crop water requirement was converted into irrigation water requirement. Different efficiencies were considered for surface irrigation (40%, 50%, and 60%), sprinkler irrigation (80% and 85%), and drip irrigation (90% and 95%).

To calculate irrigation water requirement by different irrigation methods at different efficiency levels, crop water requirement for given crop in given week was divided by efficiency factor. Different irrigation methods, efficiency levels and efficiency factors are given in table 5.2.

## **9. Regional Overview:**

Taluka-wise crop water requirement and irrigation water requirement details were compiled for 10 districts in Western Maharashtra, namely Ahmednagar, Dhule, Jalgaon, Kolhapur, Nandurbar, Nashik, Pune, Sangli, Satara, and Solapur and given in appendices Appendix B to F.

**Table 5.1: List of Agricultural Research Station for which ETr was calculated**

Sr. No.	Zone	Name of Agricultural Research Station and Location
1.	Western Ghat Zone	Zonal Agricultural Research Station, Igatpuri Dist. Nashik
2.		Agricultural Research Station, Lonavala Dist. Pune
3.		Agricultural Research Station, Radhanagari, Dist. Kolhapur
4.		Regional Wheat Rust Research Station, Mahabaleshwar, Dist. Satara
5.	Sub-Montane Zone	Zonal Agricultural Research Station, Shenda Park, Kolhapur
6.		Agricultural Research Station, Karad
7.		Agricultural Research Station, Vadgaon Maval
8.		Agricultural Research Station, Gadchinglaj
9.	Plain Zone	Zonal Agricultural Research Station, Ganeshkhind, Pune
10.		Agriculture Research Station Niphad, Dist. Nashik
11.		Agriculture Research Station Kasbe Digradj, Dist. Sangli
12.		Agriculture Research Station, Pimpalgaon Baswant, Dist. Nashik
13.		College of Agriculture, Pune
14.	Scarcity Zone	Zonal Agriculture Research Station, Solapur
15.		Central Sugarcane Research Station, Padegaon
16.		Agriculture Research Station, Mohol
17.		Pulse and Oilseed Research and Training Center, Pandharpur
18.		Agriculture Research Station, Jeur
19.		Agriculture Research Station, Savalvihir
20.		Agriculture Research Station, Chas
21.		Agriculture Research Station, Dhule
22.	Central Plateau Zone	Oil Seed Research Station, Jalgaon

**Table 5.2: Different irrigation methods, efficiency levels and efficiency factors**

Sr. No.	Irrigation Method	Efficiency Level	Efficiency factor
1.	Surface Irrigation	40%	0.4
		50%	0.5
		60%	0.6
2.	Sprinkler Irrigation	80%	0.8
		85%	0.85
3.	Drip Irrigation	90%	0.9
		95%	0.95

## 6. SUBMISSION OF DELIVERABLES

<b>Sr. No</b>	<b>Particulars</b>	<b>Phase</b>	<b>Status of Grant</b>
1.	Inception Report	I.	Yes
2.	Lysimeter Installation Report	II.	Yes
3.	<ul style="list-style-type: none"> <li>• Modified Kc Values for kharif Sesame, rabi Gram and Summer Fodder Bajra</li> <li>• Taluka wise weekly Crop Water Requirement and Irrigation Water Requirement of <i>kharif</i> Sesame, <i>rabi</i> Gram and Summer Fodder Bajra based on Modified Kc Values</li> </ul>	III.	Yes
